I have been working as a qa engineer since 5+ years.

Throughout my career I worked as a manual and automation tester for web based and mobile

based application where I mostly performed front end and back end testing

To do that I mostly worked in Agile methodology in both scrum and Kanban project

As a tester my main responsibility is to find the bug and raise into bug tracking tools like jira and

rally

As a tester I analyzed acceptance criteria, business requirements, test strategies, test plans and

wrote test cases into test rail and excel sheet and execute them manually and using automation

tool like selenium web driver api in different server/environment like qa, prepod and production

As a QA i've experience writing different kind of documentation and attend different agile

meeting with on shore and off shore team

As a automation engineer i mostly used selenium web driver api for funtional/ui testing for web

based applications

to enhance my selenium scripts i used oop concept like java

even though i have good knowledge in python in c# but i never got chance to implement using

selenium

in my career i have chance to work in different framework like hybrid data driven, add cucumber

etc where i mostly used maven as a project building tool

to maintain my test cases i used testng as a testing framework

to share our project within team members i get chance to work in different version control tool

like git and bigbucket

to run our regression suite nightly bases we trigger our project into jenkins

sometimes i performed parallel and crossbrowing testing using selenium grid and sauce lab

for reporting purpose i used log4j, ireporter extend report and customized html report

so i have a good exposure in bed cucumber framework where i mostly write feature file using

gherkin syntax and implement them using page object model concept through step definition

class

even though i m expert for ui testing but i have a hands on experience for back end testing as

well

to validate my data base i wrote some simple and complex queries using mysql and oracle

so i have sound knowledge in api testing like rest and soap using postman and soapui tools

manually

beside that i execute rest api using automation tool like jackson and rest assured framework

on the other hand i get chance to work in mobile application using automation tool like appium

for web and native app

so even though i have experience for web and hybrid app i execute mobile scripts using real

devices and simulator and emulator for both platform iOS and android

beside all of my automation experience i have a sound knowledge about web fundamentals

concepts like html, css, javascript, ajax, angular js etc

in short thats all about myself, if u have any further question i'll be happy to elaborate more
